

2. General Description

Single Button Collective (SBC) suitable for low rise developments with very little inter-floor traffic.

This system has one 'up' button at the lowest floor, one 'down' button at the highest floor and one 'up and down' button on all remaining floors.

The initial car direction is selected by the first call registered i.e. if the car is at 1st floor and a call is placed above it, the car will answer that call and all others calls registered above. At the top floor or highest call registered the car will reverse and answer all calls below.

All calls are registered on the system and answered in rotation in the direction of car travel.
