

Stannah Lifts Technical Bulletin

Issue No: M22 Date: 09/03/2004 Page: 1 of 1

LIFT TYPE: Hydraulic passenger lifts with door mounted full height infrared safety edges.

Installation / Testers system of work:

In an effort to increase reliability and to reduce installation times, the Memco full height infrared safety edges are now to be mounted on the lift car doors, directly for 2PSO and via a small bracket in the case of C/O doors. See drawings 2000482 and 2000483.

As the cable from the full height infrared safety edges is now a moving exposed part, cable chain has been provided to protect the cable from accidental damage. However the system has been designed to work in normal running conditions, this means that with the new system, the lift should NOT be run with the car doors open, as it is possible that the cable chain will catch on door gears and/or structures.

The new full height infrared safety edges assemblies can be fitted after the lift has been set up, so this should mean a minimum of disruption to the normal system of work.
