The New Passenger Lift Safety Gear Tripping Device

A new safety gear tripping device has been introduced for indirect lifts within the System21 passenger lift range. The mechanism eliminates the requirement for the safety rope which has been removed and should help to improve reliability and ease of installation.

The mechanism is attached to one of the lifting ropes which is terminated in the pit.

It allows testing of the safety gear by inducing a slack rope situation by means of an over centre cam. Activation of the device is carried out from the landing entrance (with the doors open).
